Startup placement

- TOP 10

Industrial robotic workstations for large format 3D printing (LFAM), robotic 3D printing and hybrid production combining 3D printing with CNC machining, complemented by separate technologies for robotic grinding.

SinuCraft is a technology company focused on the development of industrial systems for large format 3D printing (LFAM) and hybrid manufacturing. Their solution combines robotic 3D printing with downstream CNC machining in a single device. By linking industrial robots to a full-fledged SINUMERIK CNC control, the system can work with standard NC code just like conventional CNC machines, greatly simplifying integration into production.

The platform is designed for the production of large parts, moulds and production fixtures, where it brings greater flexibility, shorter production times and lower costs. In addition, the company is developing stand-alone robotic workstations for robotic grinding.
